

Liberdus Web Client V2 Issue 1310 Validation Report

Branch: issue-1310-share-location

Local repo: /Users/technoking/REPOS/liberdus/web-client-v2

Date: 2026-06-11

Test account: OpenAI on Devnet. Recipient: dbp.

Implementation summary: Added a Share Location attachment menu option using HTML5 `navigator.geolocation.getCurrentPosition()`. The location is sent as a standalone encrypted structured chat message: `{ type: 'location', latitude, longitude, accuracy }`. No backend, map API key, or xattach path was added.

Real send validation: A synthetic test coordinate was sent to dbp, not the tester's real physical location. Persisted message record after send: txid 8f4840aa8bc5379e7334226fc7593bb2ee3987e666866588b12a02ca6f7decb4, type location, status sent, latitude 30.267153, longitude -97.743057, accuracy 24, pending count 0.

Computer Use note: The requested Computer Use connector was attempted twice (`get_app_state` and `list_apps`) and both calls timed out after 120 seconds before any UI state was returned. Validation continued with a dedicated Chrome instance controlled through Chrome DevTools Protocol, with full-viewport screenshots captured from the actual app UI.

Validated Behaviors

- Share Location appears in the chat attachment menu.
- Successful geolocation displays a compact confirmation panel with coordinates and accuracy.
- Cancel closes the panel and preserves the typed draft.
- Refresh re-requests geolocation and updates the coordinates.
- Permission denial clears pending location state and preserves the draft.
- Send creates and persists a standalone encrypted location chat message, separate from typed draft text.
- Rendered chat bubble shows Shared location, coordinates, accuracy, and Open in Maps.

Start screen before signing in with the saved local OpenAI devnet account.

OpenAI account signed in; dbp appears in the chat list.

Direct message with dbp opened in the web client.

Attachment menu includes the new Share Location option.

HTML5 geolocation success shows coordinates and accuracy in the confirmation panel.

Location panel appears while an existing typed draft remains in the composer.

Cancel closes the panel and preserves the typed draft.

Initial staged location before Refresh.

Refresh re-requests geolocation and updates the coordinates/accuracy.

Denied geolocation clears the pending panel and preserves the draft.

Staged synthetic location immediately before sending to dbp.

Location message rendered in chat after send, with Shared location and Open in Maps.
